☐ I accept the [Terms of Service](#) and have read the [Services Privacy Policy](#)

Create Account

account creation page

2. Create an API key

After we have successfully created our account, the next step is to create an API key so that we can use it in our python code to communicate with our account.

API keys list

3. Email verification

The next thing we have to do is to verify our email which we will be using to send emails. We can verify our email in two ways, either by single sender verification or domain verification.

Coding: import os from sendgrid import

SendGridAPIClient from

sendgrid.helpers.mail import Mail

message = Mail(

from_email="verified_email@gmail.com",

```
to_emails="receiver@gmail.com", subject="test",
html_content="<p>hi</hi>"
) try:

sg = SendGridAPIClient("XXXX API key
XXXXXX") response = sg.send(message) except Exception
as

e:
    print(e)
```

The code example

Let us create a simple program in python to send an email. First, we have to install the SendGrid Python library. You can easily install it using pip by running the following command in your terminal.

```
$ pip install sendgrid
```

Once the package is installed, we can send emails using SendGrid. I have added a python code example below.

Conclusion

Hope this article is helpful. In addition to python, they also support other programming languages right out of the box.

Sample code :

```
import os from sendgrid import
SendGridAPIClient from
sendgrid.helpers.mail import Mail
```

```
message = Mail(
    from_email='from_email@example.com',
    to_emails='to@example.com', subject='Sending
    with Twilio SendGrid is Fun',
    html_content='<strong>and easy to do anywhere, even with Python</strong>') try:
    sg = SendGridAPIClient(os.environ.get('SENDGRID_API_KEY'))
    response = sg.send(message) print(response.status_code)
    print(response.body) print(response.headers) except
    Exception as e: print(e.message)
```
